Factors affecting monetization potential of videos

Key insights

- Videos generally performed more poorly as level of AI usage increased.
- The number of views increased as level of AI usage increased, but completion rates fell.
- Users click on referral links in videos with no AI usage more than when AI is used.

AI-generated videos get the most clicks

No AI vs AI-assisted: Clicks fell

- Compared to users that are able to use editing software to make an interesting and engaging content, the app's AI might still currently **pale in comparison**.
- Users **not enticed to click the AI-assisted video**, thus number of clicks fell from "No Use" to "AI-assisted".

AI-generated videos saw the highest click counts.

- **Ease of using the AI feature** causes users to **flood feeds** with AI videos, similar to other platforms like YouTube and TikTok (Forbes, 2025). Thus, a **higher proportion of clicks** go **to these videos**.
- **Novelty** of AI-generated content: Despite being less original or substantial, these videos can rack up millions of views quickly as users are **interested in clicking and watching them** (CNA, 2025).

But... AI-generated videos have lowest completion rates and click-through rates!

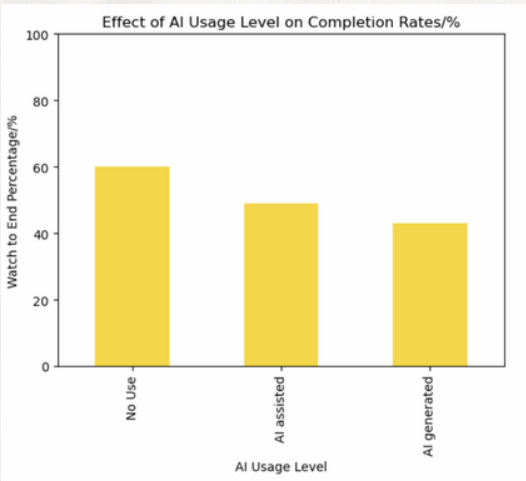

Problems with AI-generated videos

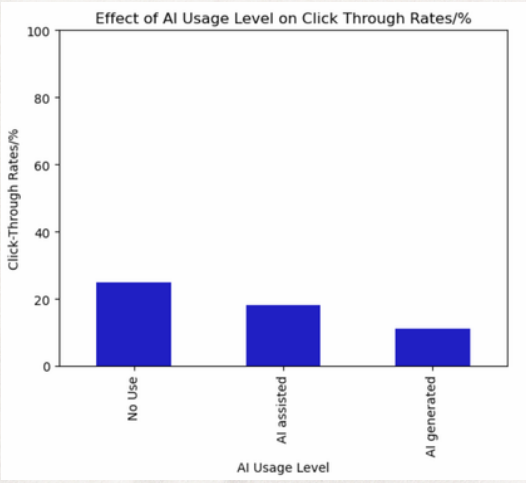

- AI-generated videos contain **less user input** and hence, **less personal touch**
  - Content may also be deemed **repetitive** and scrolled away
  - Unable to stand out in the saturated feed and fail to effectively persuade viewers to click on their referral links
- AI-generated videos are **low quality** and contain **inaccurate information**
  - **Distortion** and **misrepresentation** of products' features and functions
  - Lack **authenticity** and credibility
  - Studies have shown that users also prefer ads with a high-level of execution and thought, which low-quality AI visuals are not able to achieve (NIQ, 2024)

Authenticity of videos without AI use lead to better results!

- On the other hand, videos without AI-use have the highest completion and click-through rates
  - Creators can convey their **personality** and differing opinions,, successfully capturing the viewers' attention
- Unlike AI voices, human voices can vary pacing, pauses and tone
  - Increases **personal feel** and user engagement
  - Users feel **more connected** to the creator and are more likely to be purchase the item, thus leading to higher click through rates.

CONCLUSION: Videos with **no AI use** have the **highest monetisation potential**: Click through rates for AI generated content is more than half of no-use content.

Which demographics (age or gender groups) show the highest monetization potential?

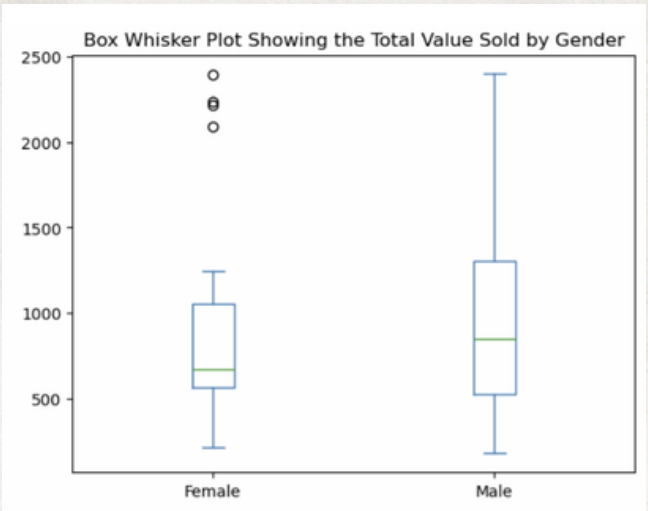

Monetisation potential increases with age.

Older content creators are perceived as more reliable and trustworthy. This leads to more brand collaborations and loyal audiences who regularly engage with their content and buy the products they promote. This then translates to monetary benefits. Studies have shown that 78% of Generation Z and Millennials cited that they gain valuable knowledge from older creators (Generation, 2023).

Additionally, older content creators have older audiences who have greater purchasing power than the younger audiences. These older viewers can purchase big-ticket items, which contributes more to the monetisation potential of older creators. Whereas, younger creators have younger audiences who are more price-sensitive.

Males generate higher and more variable sales compared to females

- Males tend to have higher monetisation potential, as seen by a **higher median total value sold** compared to females. However, their **performances are more varied**, while females tend to be **more consistent, as seen by the wider interquartile range.** There are few exceptionally high performing females, which are outliers.
- Males tend to **dominate in highly profitable categories,** such as electronics and automotive parts. Transactions are **more lucrative.** (McPhee, 2021)
- Females focused on **less profitable products,** like lifestyle and fashion (McPhee, 2021). Transactions involve **cheaper products**.

Overall Suggestions

- Balance AI Assistance with Authentic Content
- Enhance AI Tools for Better Engagement
- Leverage Gender-Based Monetization Trends
- Target Older Creators for Reliable Monetization
- Promote Time-Efficient AI Tools to Attract Creators
- Monitor AI Content Saturation and Quality Control

Overall, AI videos eye-catching at first glance→will click. BUT less personal feel, consumers less inclined to stay till the end and less persuaded to buy.
